Claims

[c1]   A method for managing electronic forms, said method
        including:
        transmitting at least one host form having form fields
        from a host to a remote device having a remote
        database;
        entering form data into said form fields to create at least
        one remote form;
        communicating with said host to transmit said at least
        one remote form to said host;
        mapping said form fields to database record fields within
        a database of said host; and,
        synchronizing said host database with said remote
        database.

[c2]   The method of claim 1, further including synchronizing
        at least one host form with at least one remote form.

[c3]   The method of claim 1, further including synchronizing
        at least one host application with at least one remote ap-
        plication.

[c4]   The method of claim 1, wherein mapping including pre-
        determined mapping rules.

[c5]   The method of claim 1, wherein synchronizing includes calculating hash values to determine if a data change exists.

[c6]   The method of claim 1, further including verifying credentials of a user of said remote device.
